Retained form-control mismatch: evidence for Ada
Unchanged checkpoint: 5644fcaf9014928a817dfc0cd470991329e141ec
Runtime: PDF Oxide 0.3.78, pypdfium2 5.14.0, PDFium 156.0.8076.0, MuPDF 1.26.7

The default oracle still records 3941 and 1238 differing PDFium glyph pixels at 144 DPI.
Source, tests, renderer defaults and acceptance are unchanged. No PDF correction was applied.

The source/native appearance streams, font/resource graphs, BBoxes and Matrices are identical.
A manual page-content derivative using the same AP matches native output in every tested mode.
The source AP remains unchanged after PDFium form initialization, rendering and saving.
LCD source/native comparison is exact at 72, 144 and 288 DPI; MuPDF is exact at all three DPIs.
Source widget-region pixels ignore LCD/print/no-smooth switches, while page text responds.

Evidence supports a PDFium interactive-widget/page rendering-option discontinuity.
Current official source corroborates default ClearType options on the widget drawing path.
The installed binary's exact source commit is unavailable; this source explanation is corroborating.

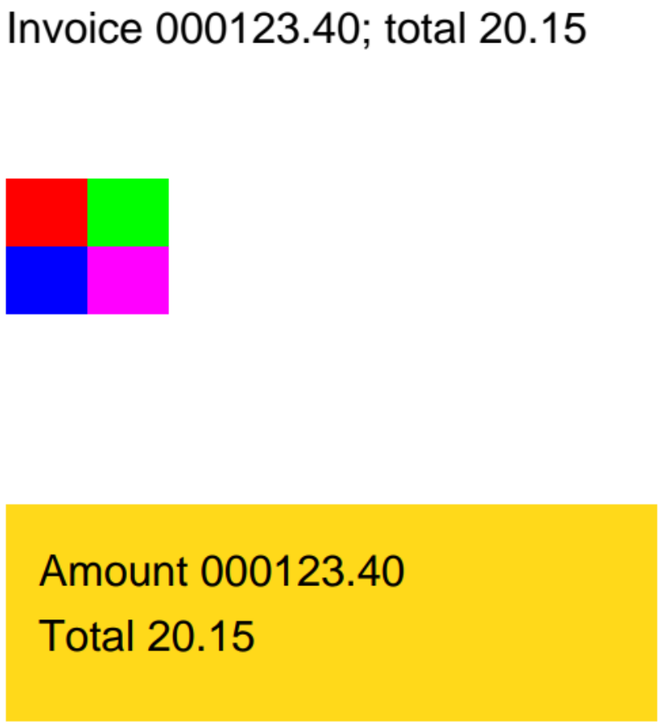

For each control: default comparison, LCD diagnostic comparison, then native/manual comparison.
Every page labels its rendering mode. LCD is a separate diagnostic, never a replacement oracle.
All original PDF/PNG files, hashes, decoded content/resources and the strict failure are in the archive.
All content is synthetic; no credentials or private documents are included.

No broad appearance qualification is granted. Exact default PDFium parity remains unmet.
Ada must decide how this evidence affects acceptance; merge/release/redaction holds remain.

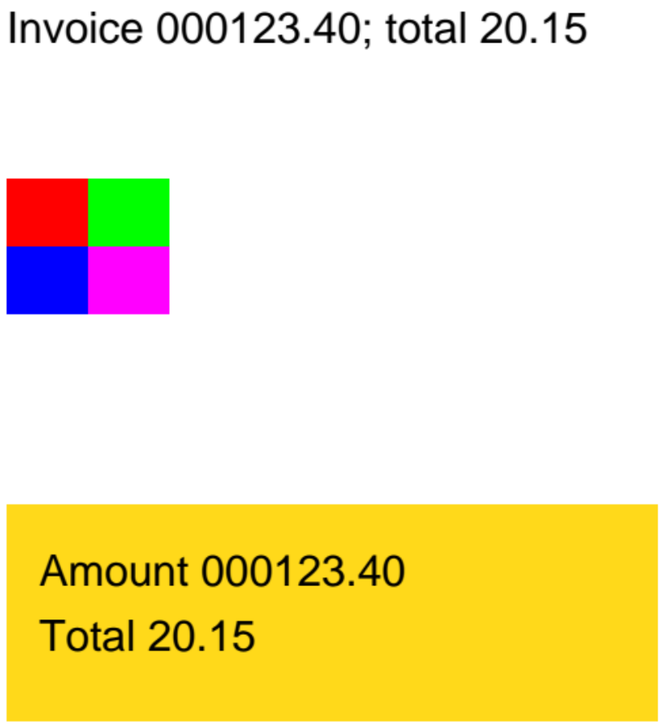

retained-3941 | UNCHANGED DEFAULT ORACLE

Default source/output: 3941 differing pixels. Exact parity remains false.
